MEDICAL DEVICE SALES INTERVIEW STUDY GUIDE

INDIBA CT9 and ASA Laser HIRO TT

Two technologies. One stronger clinical story. A practical guide for explaining, positioning and selling a complementary rehabilitation and musculoskeletal portfolio.

INDIBA CT9

Versatile 448 kHz monopolar radiofrequency for daily clinical use, rehabilitation and treatment integration.

ASA Laser HIRO TT

High-intensity pulsed Nd:YAG HILT with SmartCooler for pain, acute presentations and deeper targets.

Core interview message: Do not sell a machine in isolation. Connect the technology to the right patient, the clinic's workflow, the clinician's confidence and a realistic business case.

Prepared from: INDIBA_CT9_ASA_HIRO_TT_Sales_Interview.pptx | Use approved indications, training and local regulatory guidance for all clinical claims.

01 / PRODUCT EXPLANATION

The portfolio in one sentence

CT9 broadens a clinic's everyday capability; HIRO TT deepens and differentiates the offer.

INDIBA CT9

Versatile RF platform

CT9 uses stable 448 kHz monopolar radiofrequency with thermal and non-thermal modes. It is positioned as a broad platform that can fit across the patient journey and integrate with manual therapy, exercise and active rehabilitation.

Best explained as

"A platform you can use across the patient journey."

Best buying case

A clinic wants broad utilization, multiple specialties, daily use and a modality that many therapists can adopt.

ASA LASER HIRO TT

Focused high-intensity intervention

HIRO TT combines high-intensity pulsed Nd:YAG HILT with SmartCooler thermal exchange. It is positioned for acute pain, deeper musculoskeletal targets, demanding sports cases and a premium, clearly differentiated service line.

Best explained as

"High intensity and depth with a comfort and control strategy."

Best buying case

A clinic wants a distinctive intervention it can explain clearly, deliver confidently and attach to higher-value care.

The bridge: As Product Specialist, translate features into treatment pathways, staff adoption, patient experience and return on investment.

How to choose in a conversation

Clinic signal	Lead with	Why
Wants one versatile platform used by several therapists	CT9	Broad workflow fit and multiple specialties.
Sees acute pain, deep targets or demanding sports cases	HIRO TT	Intensity, depth and differentiated intervention.
Already combines modalities with manual therapy or exercise	CT9, then bridge to HIRO TT	Build a coherent pathway instead of a single session pitch.
Wants a premium, focused service line	HIRO TT	Clear patient story and higher-value positioning.

02 / TECHNICAL BASICS

Technical basics in plain language

CT9 BASICS

- **Modality:** monopolar radiofrequency.
- **Frequency:** stable 448 kHz.
- **Modes:** thermal and non-thermal.
- **Workflow:** integrates with hands on treatment, movement and exercise.
- **Clinical fit:** comfort support, pain modulation, edema support, tissue preparation and chronic rehabilitation.

Simple explanation: CT9 gives the clinician an adjustable RF platform that can be used before, during or alongside broader rehabilitation work.

HIRO TT BASICS

- **Modality:** high-intensity pulsed Nd:YAG laser, HILT.
- **Peak intensity:** up to 15,000 W/cm2.
- **Pulse:** up to 100 microseconds.
- **Cooling:** SmartCooler range 18 to 28 degrees C.
- **Interface:** 10-inch touchscreen.
- **Delivery:** one optic fiber and three handpieces.

Simple explanation: HIRO TT gives the therapist a focused, high-intensity pulsed intervention designed for depth, with localized cooling to support comfort and control.

What the numbers mean in a sales conversation

448 kHz
CT9 RF frequency; use it as a proof point for a stable, defined platform.

15,000 W/cm2
HIRO TT maximum intensity; supports the story of focused high-intensity intervention.

18 to 28 degrees C
SmartCooler range; links intensity with comfort and control.

Interview discipline: State the technical fact, translate it into clinician relevance, then connect it to patient or business value. Example: "The 448 kHz platform gives the clinic a repeatable RF foundation; commercially, that matters because it can support several treatment pathways rather than one narrow indication."

Important: technical specifications and clinical claims must be presented within the manufacturer's approved indications, training requirements and local regulatory framework.

03 / BENEFITS

Benefits by stakeholder

Stakeholder	CT9 benefit	HIRO TT benefit
Patient	Comfortable, adjustable support that can prepare or accompany rehabilitation.	A treatment that feels active and targeted, with localized cooling to support comfort and control.
Clinician	Versatile platform that can be integrated with manual therapy, exercise and individualized protocols.	Focused high-intensity option for acute pain, deeper targets and demanding cases.
Clinic owner	Broad utilization across clinicians, specialties and body areas.	Distinctive premium intervention and a focused higher-value service line.
Team	Workflow simplicity, accessories and repeatable pathways can support adoption.	Clear interface and memorable patient story can support confident explanation.

The complementary patient pathway

Settle and prepare

CT9 can support a comfortable start, tissue preparation and integration with hands on care.

Target and progress

HIRO TT can add a focused, deeper intervention when appropriate, followed by movement, exercise and measurable progression.

> **Best benefit statement:** "The value is not only the device. It is the clinic's ability to turn the device into a confident treatment pathway that patients understand and return for."

Use cases to remember

- **Sports rehabilitation:** CT9 supports comfort and preparation; HIRO TT adds focused depth when appropriate; hands on care and exercise drive return to play.
- **MSK and pain clinics:** listen to pain behavior, irritability and goals; match the modality; explain what the patient may feel; link treatment to movement and self-management.
- **Multi-specialty clinics:** use CT9 as the utilization anchor and HIRO TT as the differentiated premium intervention.

04 / SALES ARGUMENTS

Sales arguments that sound consultative

Earn the right to recommend. Start with the clinic's ambition, not a feature list.

Five-step first meeting

1. Discover

"Which patient group do you most want to grow?"

2. Qualify

"What does your current workflow handle well, and where is it limited?"

3. Demonstrate

Show the modality in the language of the clinic's patient and staff.

4. Prove value

Use protocols, training, utilization and real clinic economics.

5. Close next step

Agree on a demo, clinical evaluation or business case.

Argument bank

Customer concern	Strong response
"Why do we need another modality?"	"I would first understand the gap in your current pathway. CT9 may broaden daily capability, while HIRO TT may add a focused intervention for patients or cases your team wants to serve better."
"The price is high."	"That is fair. Rather than defend the price in isolation, I would ask what utilization level would make the investment compelling and build the case from your actual patient volume and service-line goals."
"Will staff actually use it?"	"Adoption depends on workflow fit. I would map who will use it, for which patients, with what training and how it integrates with the treatment the team already delivers."
"Is this only for sports clinics?"	"Sports rehabilitation is a strong use case, but the broader question is the patient pathway. CT9 fits broad rehabilitation and MSK workflows; HIRO TT fits acute pain, deeper targets and focused premium interventions."

ROI conversation

Use the clinic's actual numbers. Start with patient volume, define the service line, estimate realistic treatment frequency, and measure utilization and contribution margin. Avoid generic payback promises.

> **Commercial thesis:** One platform can expand the base through utilization; the other can elevate the offer through differentiation. The recommendation depends on the clinic's ambition and operating model.

Practice answers

1. How would you explain the difference between CT9 and HIRO TT?

> CT9 is the versatile 448 kHz monopolar RF platform for daily use across rehabilitation and integrated treatment pathways. HIRO TT is the more focused high-intensity pulsed Nd:YAG HILT solution for acute pain, deeper musculoskeletal targets and premium differentiation. I would position them as complementary, not as one universal winner.

2. When would you recommend CT9?

> When the clinic wants broad utilization, several therapists or specialties can use the platform, and the team already combines modalities with manual therapy or exercise. I would emphasize workflow fit, patient comfort and repeatable pathways.

3. When would you recommend HIRO TT?

> When the clinic sees acute pain, deeper targets or demanding sports cases and wants a clearly differentiated, higher-value intervention. I would explain the intensity and depth story together with SmartCooler support for comfort and control.

4. What is your approach to a first customer meeting?

> I would discover the priority patient group, qualify the current workflow and limitations, demonstrate the relevant modality in the clinic's language, prove value with utilization and training, and finish with a concrete next step such as a demo, clinical evaluation or business case.

5. How do you handle a price objection?

> I acknowledge the concern and clarify whether it is mainly financial, clinical or workflow-related. Then I ask what utilization level would make the investment compelling and build a realistic case from the clinic's own patient volume, treatment frequency and contribution margin.

6. How do you avoid overclaiming?

> I stay within approved indications, manufacturer training and local regulatory requirements. I distinguish technical specifications from clinical outcomes, use careful language such as "supports" when appropriate, and bring the conversation back to the patient's pathway and the clinician's judgment.

7. What does success look like after the sale?

> Successful adoption: trained staff, clear protocols, regular utilization, a patient explanation the team can repeat confidently, and measurement of service-line performance. The goal is not only installation; it is a working clinical and commercial pathway.

06 / THREE-MINUTE PRESENTATION

Ready-to-deliver script

> **Delivery tip:** Speak in a calm, customer-led sequence: clinic ambition, two technologies, complementary pathway, business value, next step.

Opening 0:00-0:25

"Today I would like to present two complementary technologies for rehabilitation, sports medicine and musculoskeletal clinics: INDIBA CT9 and ASA Laser HIRO TT. My focus is not simply on the devices. It is on how a Product Specialist connects each platform to the right patient, the right workflow and a realistic business case."

CT9 0:25-1:05

"INDIBA CT9 is a versatile 448 kHz monopolar radiofrequency platform. It offers thermal and non-thermal modes and can be integrated with manual therapy, active rehabilitation and exercise. I would position CT9 for clinics that want broad daily utilization, multiple specialties and a comfortable, adjustable modality that can support the patient journey from preparation through progression."

ASA Laser HIRO TT 1:05-1:45

"ASA Laser HIRO TT takes a different role. It uses high-intensity pulsed Nd:YAG HILT, with up to 15,000 watts per square centimeter, pulse durations up to 100 microseconds and SmartCooler thermal exchange in the 18 to 28 degree range. I would recommend it when a clinic sees acute pain, deeper targets or demanding sports cases and wants a focused, premium intervention that patients can understand and value."

Clinical pathway 1:45-2:20

"The strongest story is complementary. CT9 can help settle, prepare and integrate treatment with hands on care. HIRO TT can add a more targeted, deeper intervention when appropriate. Then the clinician progresses the patient with movement, exercise and measurable goals. In sports rehabilitation, that creates a pathway from acute complaint to return to play. In MSK and pain care, it makes the treatment feel purposeful and connected to the patient's next step."

Business value 2:20-2:45

"For the clinic owner, CT9 can broaden utilization across clinicians, specialties and body areas. HIRO TT can create a differentiated, higher-value service line. I would not promise a generic payback period. I would use the clinic's actual patient volume, realistic treatment frequency, utilization and contribution margin."

Close 2:45-3:00

"My next step would be to identify the priority patient group, demonstrate the best-fit technology and build the business case together. That is how I would sell the clinical pathway, not just the machine."

07 / VOCABULARY

Medical device sales vocabulary

Acute presentation
A patient problem that has appeared recently or is in an active phase.

Adoption
The extent to which staff actually use a device confidently and consistently after purchase.

Approved indication
The use or clinical purpose authorized by the relevant regulatory framework and manufacturer documentation.

Contribution margin
Revenue from a service minus the variable costs directly associated with delivering it.

Deep target
A tissue or musculoskeletal area where the clinic wants a treatment effect at greater depth.

Differentiation
A clear reason a clinic, service or technology stands apart from alternatives.

Edema support
Supportive treatment aimed at managing swelling within the approved clinical context.

HILT
High-intensity laser therapy; in this deck, pulsed Nd:YAG laser treatment.

Localized cooling
Cooling applied at or near the treatment area to support comfort and control.

Monopolar RF
Radiofrequency energy delivered using a single active electrode configuration.

Nd:YAG
A laser type using neodymium-doped yttrium aluminum garnet as its gain medium.

Patient pathway
The sequence of assessment, treatment, progression and follow-up a patient experiences.

Premium service line
A focused clinical offering positioned as differentiated and higher value.

Protocol
A defined treatment approach or sequence used by the clinical team.

Return to play
The staged process of helping an athlete resume sport safely and confidently.

ROI
Return on investment; the value generated relative to the investment made.

Service-line economics
The volume, pricing, costs, utilization and margin associated with a defined clinical offering.

SmartCooler
The HIRO TT cooling system described in the deck as supporting comfort and thermal exchange.

Thermal and non-thermal modes
Modes that are intended to produce different treatment experiences or biological effects within approved use.

Utilization
How frequently and broadly a device is used across staff, patients and treatment areas.

> **Final memory hook:** CT9 = broad capability and daily integration. HIRO TT = depth, intensity and differentiation. The Product Specialist = the bridge between technology, treatment pathway and business case.

This study guide is an interview preparation aid based on the supplied presentation. It is not a substitute for the manufacturer's instructions for use, clinical training, or local regulatory and compliance guidance.
